

# Qualitative Comparative Analysis

Claude Rubinson  
University of Houston—Downtown  
Houston, TX  
rubinsonc@uhd.edu  
<http://gator.uhd.edu/~rubinsonc/>

55th Annual Meeting of the  
Western Social Science Association  
Denver, Colorado  
April 12, 2013

# Overview

- Review of QCA publications and software
- QCA as an investigation of invariance
- Three analytic components of QCA
  - Data set calibration
  - Necessity analysis
    - Consistency and coverage measures for necessity
    - Testing for necessary conditions
  - Sufficiency analysis
    - Consistency and coverage measures for sufficiency
    - Constructing and reducing truth tables
- Interrogating the solutions

# Primary Readings on QCA

- Ragin and Rubinson (2009) “The Distinctiveness of Comparative Research”
- Ragin and Rubinson (2011) “Comparative Methods”
- Ragin (2008) *Redesigning Social Inquiry*
- Ragin (1987) *The Comparative Method*

## Secondary Sources

- Compasss web site (<http://www.compasss.org>)
- Schneider and Wagemann (2012) *Set-Theoretic Methods for the Social Sciences*
- Goertz (2006) *Social Science Concepts*
- Ragin (2000) *Fuzzy-Set Social Science*
- Rihoux and Ragin (2009) *Configurational Comparative Methods*

# Software

Ragin's fs/QCA (<http://www.fsqca.com>):

- always produces correct results, intermediate solutions, relatively user-friendly, described in *RSI*, cutting edge
- but: Windows-only, buggy, out of date documentation, the dreaded prime implicant chart, no tools for interrogating the analysis, cutting edge

Rubinson's acq & Kirq (<http://www.grundrisse.org/qca/>):

- always produces correct results, sophisticated necessity analysis, supports contradictions and impossible conditions, user-friendly, cross-platform, tools for interrogating the analysis, no prime implicant chart
- but: no intermediate solutions, solution complexity

# Other Software

## Cronqvist's TOSMANA:

- visualizations; cross-platform (via Mono)
- but: doesn't support fuzzy-set QCA; inspired by QCA 3.0

## Dusa's QCA for R (also Huang's QCA3 for R):

- cross-platform (via R)
- but: no GUI interface; inspired by TOSMANA/QCA 3.0

## Longest and Vaisey's fuzzy module for Stata:

- cross-platform (via Stata); focus on probabilistic methods

# Varieties of QCA: Crisp Sets, Fuzzy Sets, & Multi-Valued Sets

- *The Comparative Method* (1987) describes “crisp-set QCA”
- *Fuzzy-Set Social Science* (2000) describes “fuzzy-set analysis”
- *Redesigning Social Inquiry* (2008) unifies “crisp-set QCA” and “fuzzy-set QCA”
  - crisp-set QCA is a special form of fuzzy-set QCA
  - fs/QCA, acq, and Kirq are all based on the *RSI* algorithms
- What about multi-valued QCA?

# What is QCA?

- Originated as a formalization of small-N, comparative-historical research.
- QCA is a technique for identifying and analyzing invariant (consistent) relationships.
- Characterized by the search for necessary and sufficient conditions.
- Is QCA necessarily small-N?
- Is QCA necessarily case-oriented?

# Invariant Relationships

- Definition: Certain aspects of cases tend to co-occur.
  - Tenured faculty tend to have many publications
  - Religious fundamentalists tend to be politically conservative
  - “business leaders and owners of capital ... are overwhelmingly Protestant” (Weber 1958:35)

# Invariant Relationships

- Definition: Certain aspects of cases tend to co-occur.
  - Tenured faculty tend to have many publications

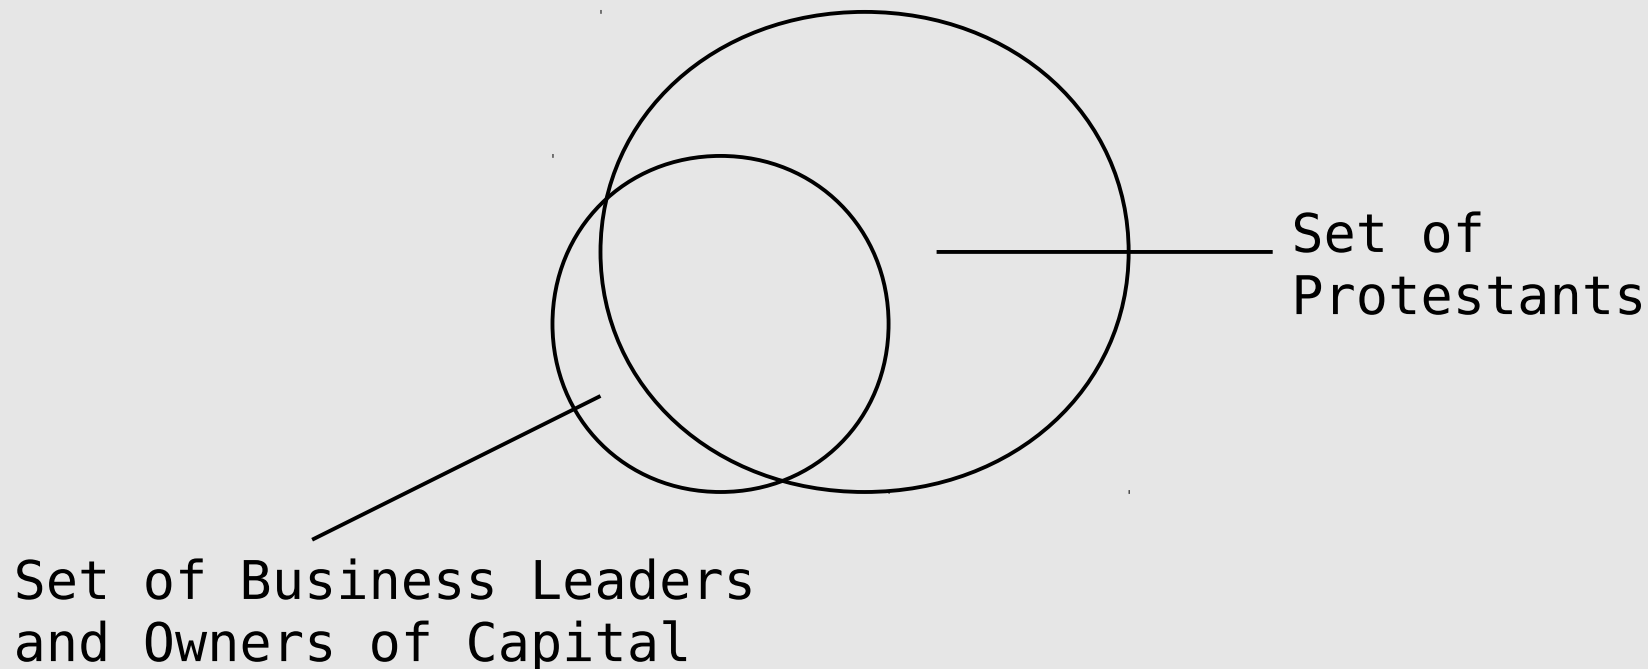

# Invariant Relationships

- Definition: Certain aspects of cases tend to co-occur.
  - Religious fundamentalists tend to be politically conservative.

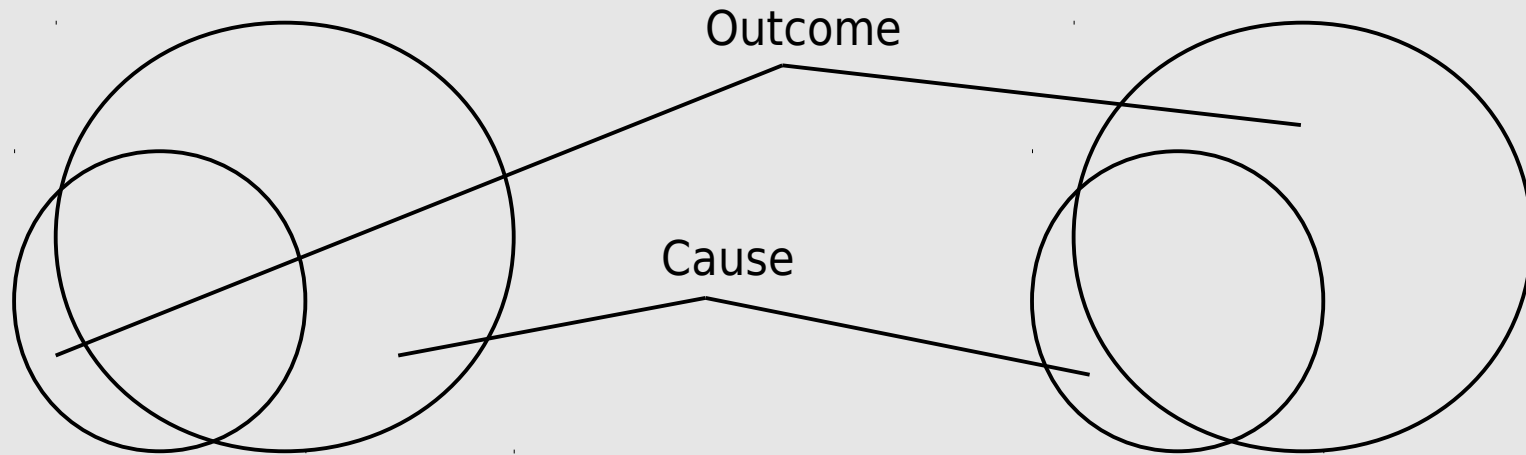

# Invariant Relationships

- Definition: Certain aspects of cases tend to co-occur.
  - “business leaders and owners of capital ... are overwhelmingly Protestant” (Weber 1958:35)

# Invariant Relationships

Subset relationship consistent with necessity ( $X \geq Y$ )

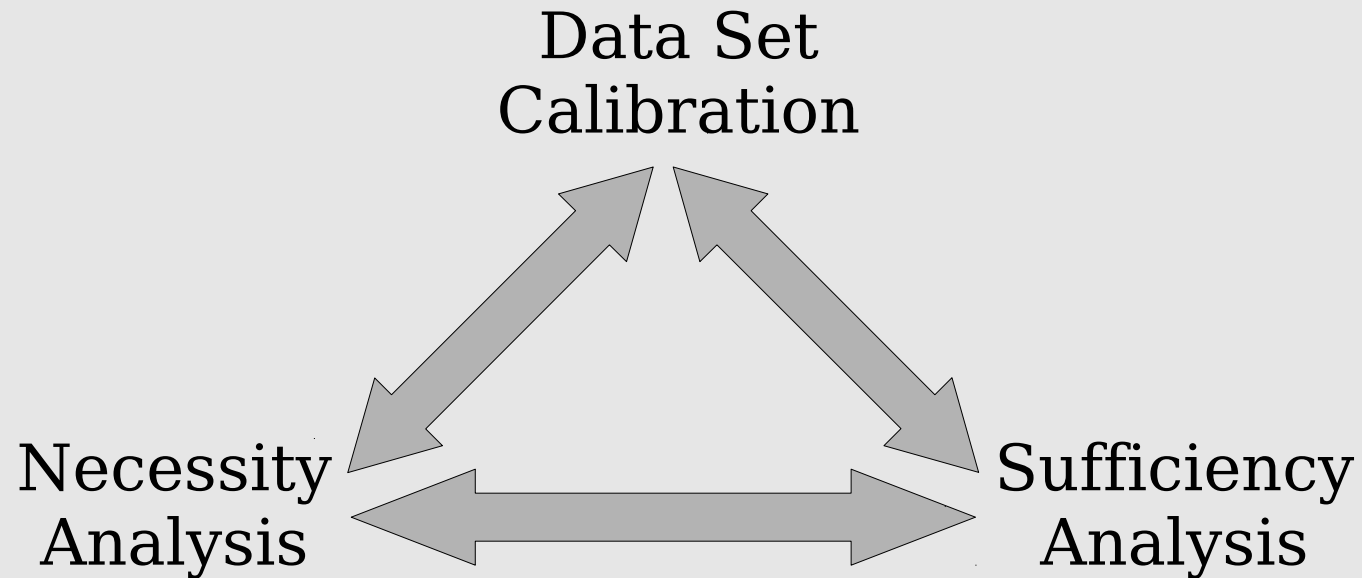

Subset relationship consistent with sufficiency ( $Y \geq X$ )

# Invariant Relationships

- Definition: Certain aspects of cases tend to co-occur.
  - Does not imply determinism (or stochasticism)
  - Is not vulnerable to a single disconfirming case
  - Is fundamentally set theoretic
  - Parallels how we typically formulate social theory:
    - The modern world-system is a capitalist world-economy characterized by a single division of labor that prioritizes the endless accumulation of capital.
    - During unsettled periods, people actively use culture to learn new ways of being.

# Three Analytic Components of QCA

# Retroductive Nature of QCA

## Example: Brown and Boswell (1995)

Truth Table with Contradiction (from Table 4 of Brown and Boswell 1995)

Recent Black Migrants	Weak Union	Black Strikebreaking	Observations
T	T	T	East Chicago, Pittsburgh, Youngstown
T	F	Con	Buffalo, Chicago, Gary, Johnstown, [Cleveland]
F	T	F	Bethlehem, Joliet, McKeesport, Milwaukee, New Castle, Reading
F	F	F	Decatur, Wheeling

# Retroductive Nature of QCA

## Example: Brown and Boswell (1995)

Revised Truth Table without Contradiction (from Table 5 of Brown and Boswell 1995)

Recent Black Migrants	Weak Union	Local Govt Repression	Black Strikebreaking	Observations
T	T	T	T	East Chicago, Pittsburgh, Youngstown
T	T	F	—	
T	F	T	T	Buffalo, Chicago, Gary, Johnstown
T	F	F	F	Cleveland
F	T	T	F	Bethlehem, Joliet, McKeesport, New Castle, Reading
F	T	F	F	Milwaukee
F	F	T	F	Decatur
F	F	F	F	Wheeling

# Boolean Algebra

- UPPERCASE for the presence of a condition
- lowercase for the absence of a condition
- Negation
$$\sim A = 1 - A$$
$$a = 1 - A$$
- Logical and (Boolean multiplication)
$$A \cdot b = Ab = \min(A, b)$$
- Logical or (Boolean addition)
$$A + b = \max(A, b)$$

A vertical teal decorative border with a wavy, marbled texture runs along the left edge of the slide.

# Calibrating Data Sets

# Data Set Calibration

- The process of constructing fuzzy-sets
- May be crisp or fuzzy
- Is about defining set memberships
  - degree of membership in the set of rich people (vs annual income)
  - degree of membership in the set of developed countries (vs GDP/capita)
- Importance of negation and asymmetry
  - degree of membership in the set of *not* rich people
  - degree of membership in the set of *not* developed countries

# Data Set Calibration

- Instrument calibration is routine in the natural sciences; largely absent in the social sciences.
- Conventional statistics emphasize relative effects: Paul is poorer than Peter; the United States' infant mortality rate is greater than that of Japan.
- Calibration allows us to state that an individual is poor or that a country's infant mortality rate is high.
- Calibration requires application of theoretical and substantive knowledge: What does it mean to classify a country as partially versus fully democratic?

# Calibrating Fuzzy Sets

Crisp set	Three-value fuzzy set	Four-value fuzzy set	Six-value fuzzy set	Continuous fuzzy set
1 = fully in	1 = fully in	1 = fully in	1 = fully in	1 = fully in
	0.67 = more in than out	0.67 = more in than out	0.8 = mostly but not fully in  0.6 = more or less in	Degree of membership is more "in" than "out" $0.5 < X < 1$
----- 0.5 = Crossover Point -----				
		0.33 = more out than in	0.4 = more or less out  0.2 = mostly but not fully out	Degree of membership is more "out" than "in" $0.0 < X < 0.5$
0 = fully out	0 = fully out	0 = fully out	0 = fully out	0 = fully out

# Analyzing Necessary Conditions

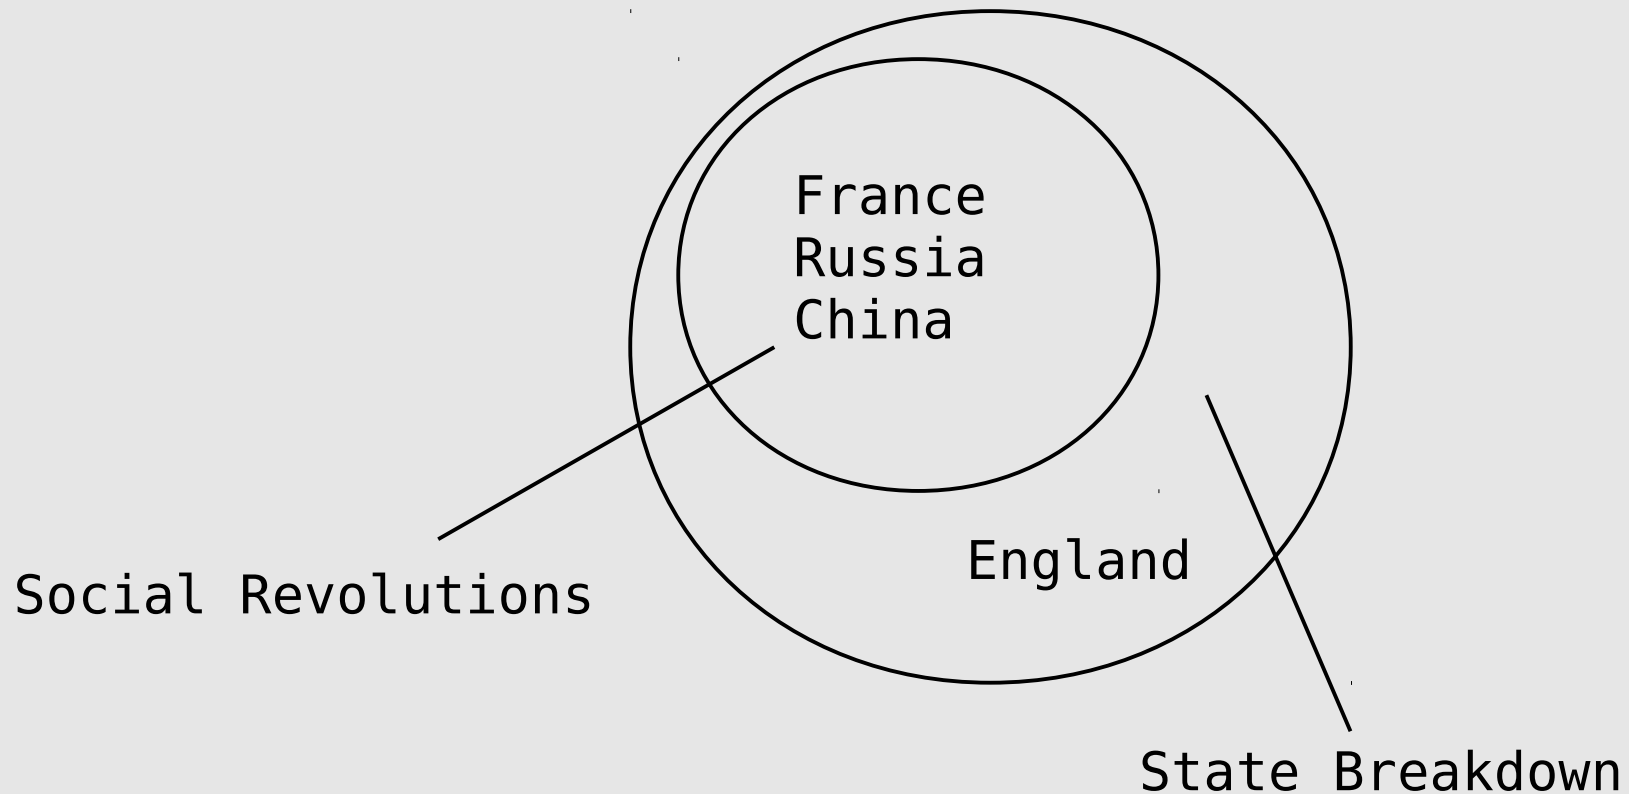

# Necessity Analysis

- Underdeveloped in the literature; QCA development has focused on sufficiency analysis
- Kirq and acq have sophisticated necessity testing

# Necessary Conditions

Causal condition must (almost always) be present for outcome to occur.

Outcome is a subset of Cause

# Fuzzy Subset Relationship Consistent with Necessity

Outcome is a subset of Cause ( $X \geq Y$ )

# Assessing Necessary Conditions

- *Consistency* measures degree to which subset relationship is “consistent” with necessity

Subset relationship consistent  
with necessity

Subset relationship with  
substantial inconsistency

# Assessing Necessary Conditions

- *Coverage* measures how “relevant” a necessary condition is

Empirically relevant necessary condition (high consistency)

Empirically irrelevant necessary condition (perfect consistency)

# Testing for Necessary Conditions

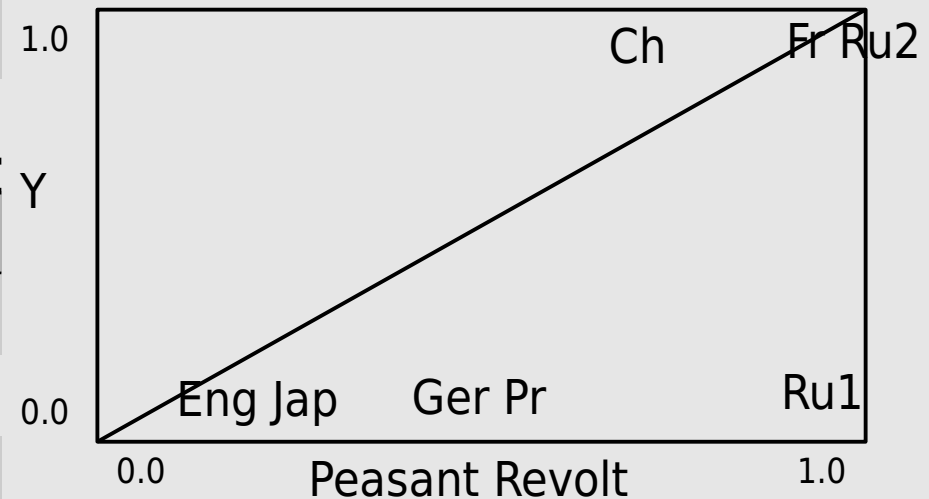

Revolution	Brk	Rev	Success?
France 1789	1.00	1.00	1.0
Russia 1917	1.00	1.00	1.0
China 1911	1.00	0.75	1.0
England 1688	1.00	0.00	0.0
Russia 1905	0.49	1.00	0.0
Germany 1848	0.25	0.49	0.0
Prussia 1807	0.75	0.49	0.0
Japan 1868	0.75	0.00	0.0

# Testing for Necessary Conditions

Revolution	Brk	Rev	Success?
France 1789	1.00	1.00	1.0
Russia 1917	1.00	1.00	1.0
China 1911	1.00	0.75	1.0
England 1688	1.00	0.00	0.0
Russia 1905	0.49	1.00	0.0
Germany 1848	0.25	0.49	0.0

Japan 1868	0.75	0.00	0.0

Term	Consis	Cov
BREAKDOWN *	1.00	0.48
REVOLT	0.92	0.58
Solution	0.92	0.69

# Testing for Necessary Conditions

- Assess consistency before coverage
- Join terms with logical or (e.g.,  $A+B+C$ )
- Many solutions are possible
- Use of theory is crucial

# Analyzing Sufficient Conditions

# Sufficiency Analysis

- More mature than necessity analysis; QCA development—and applications—have focused on sufficiency analysis
- Emphasis on causal complexity (a.k.a., multiple conjunctural causation, “recipes,” equifinality, or INUS conditions)

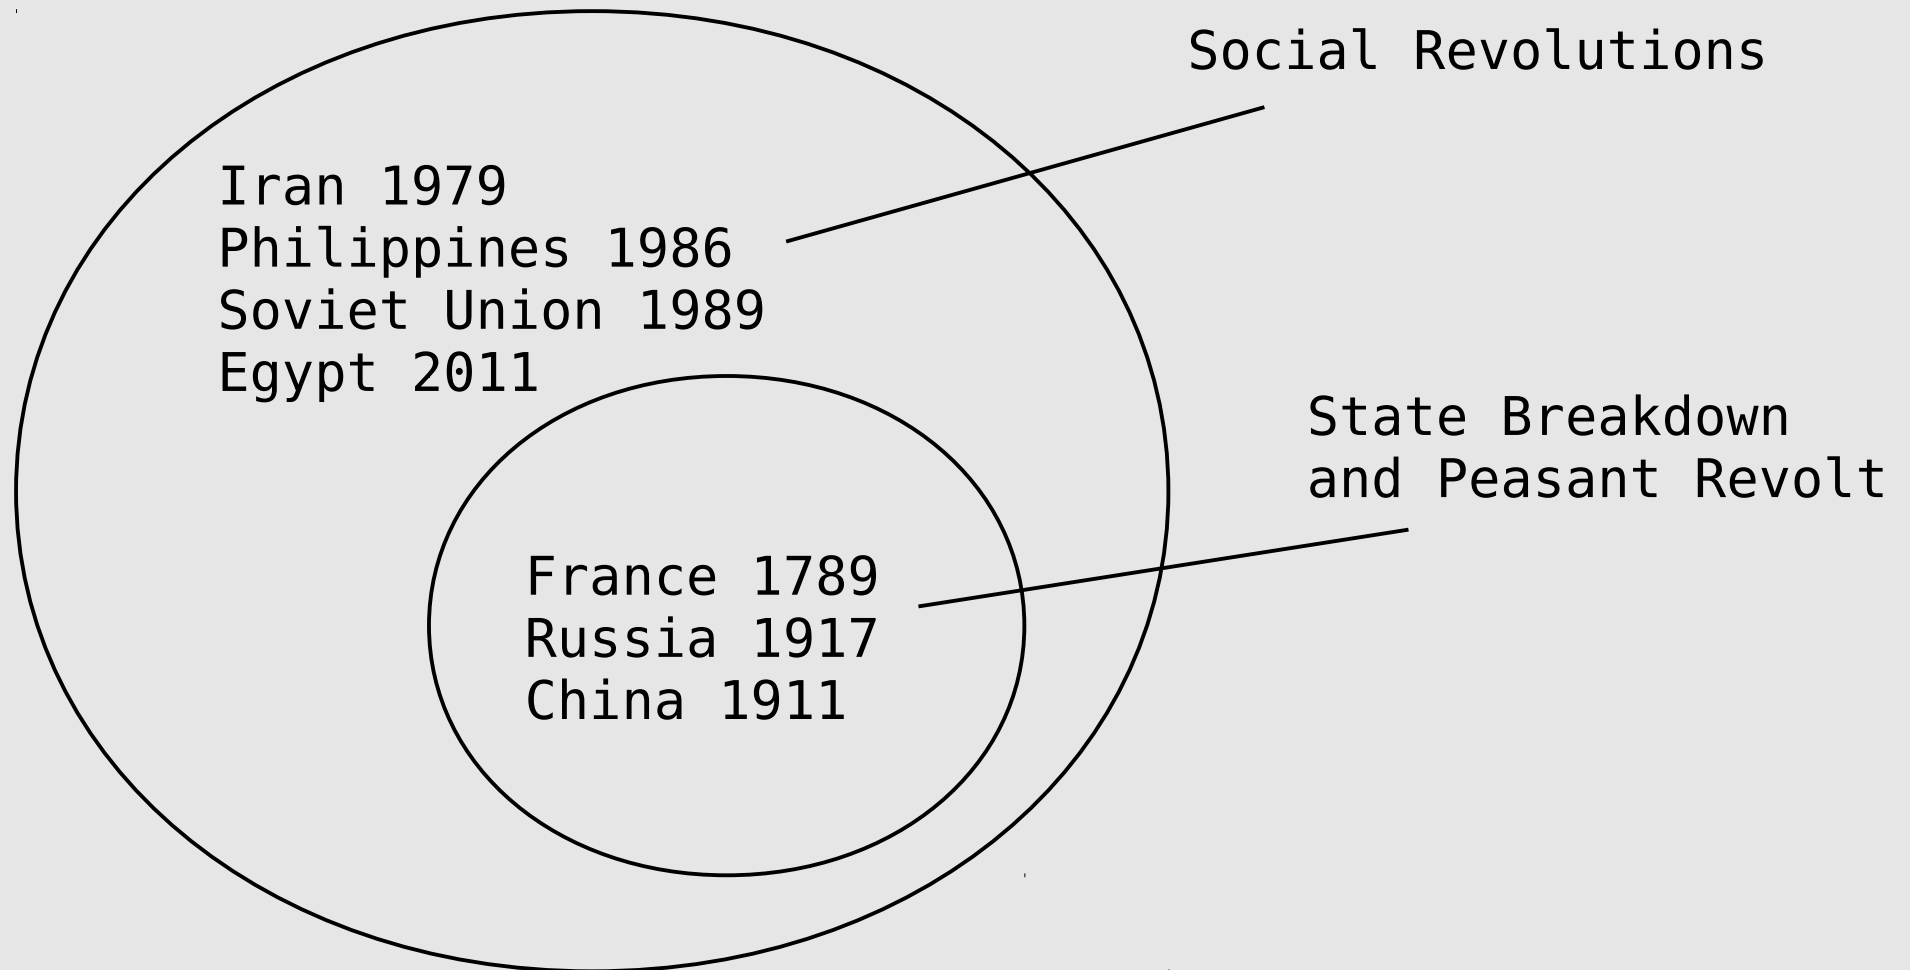

Feature	fs/QCA	Kirq & acq
Based on RSI Algorithms	✓	✓
Complex Solutions	✓	✓
Intermediate Solutions	✓	
Parsimonious Solutions	✓	✓
Impossible Conditions		✓
Contradictions		✓

# Sufficient Conditions

Outcome (almost) always occurs when causal condition is present.

Cause is a subset of Outcome

# Assessing Sufficient Conditions

- *Consistency* measures degree to which subset relationship is “consistent” with sufficiency

Subset relationship consistent with sufficiency

Subset relationship with substantial inconsistency

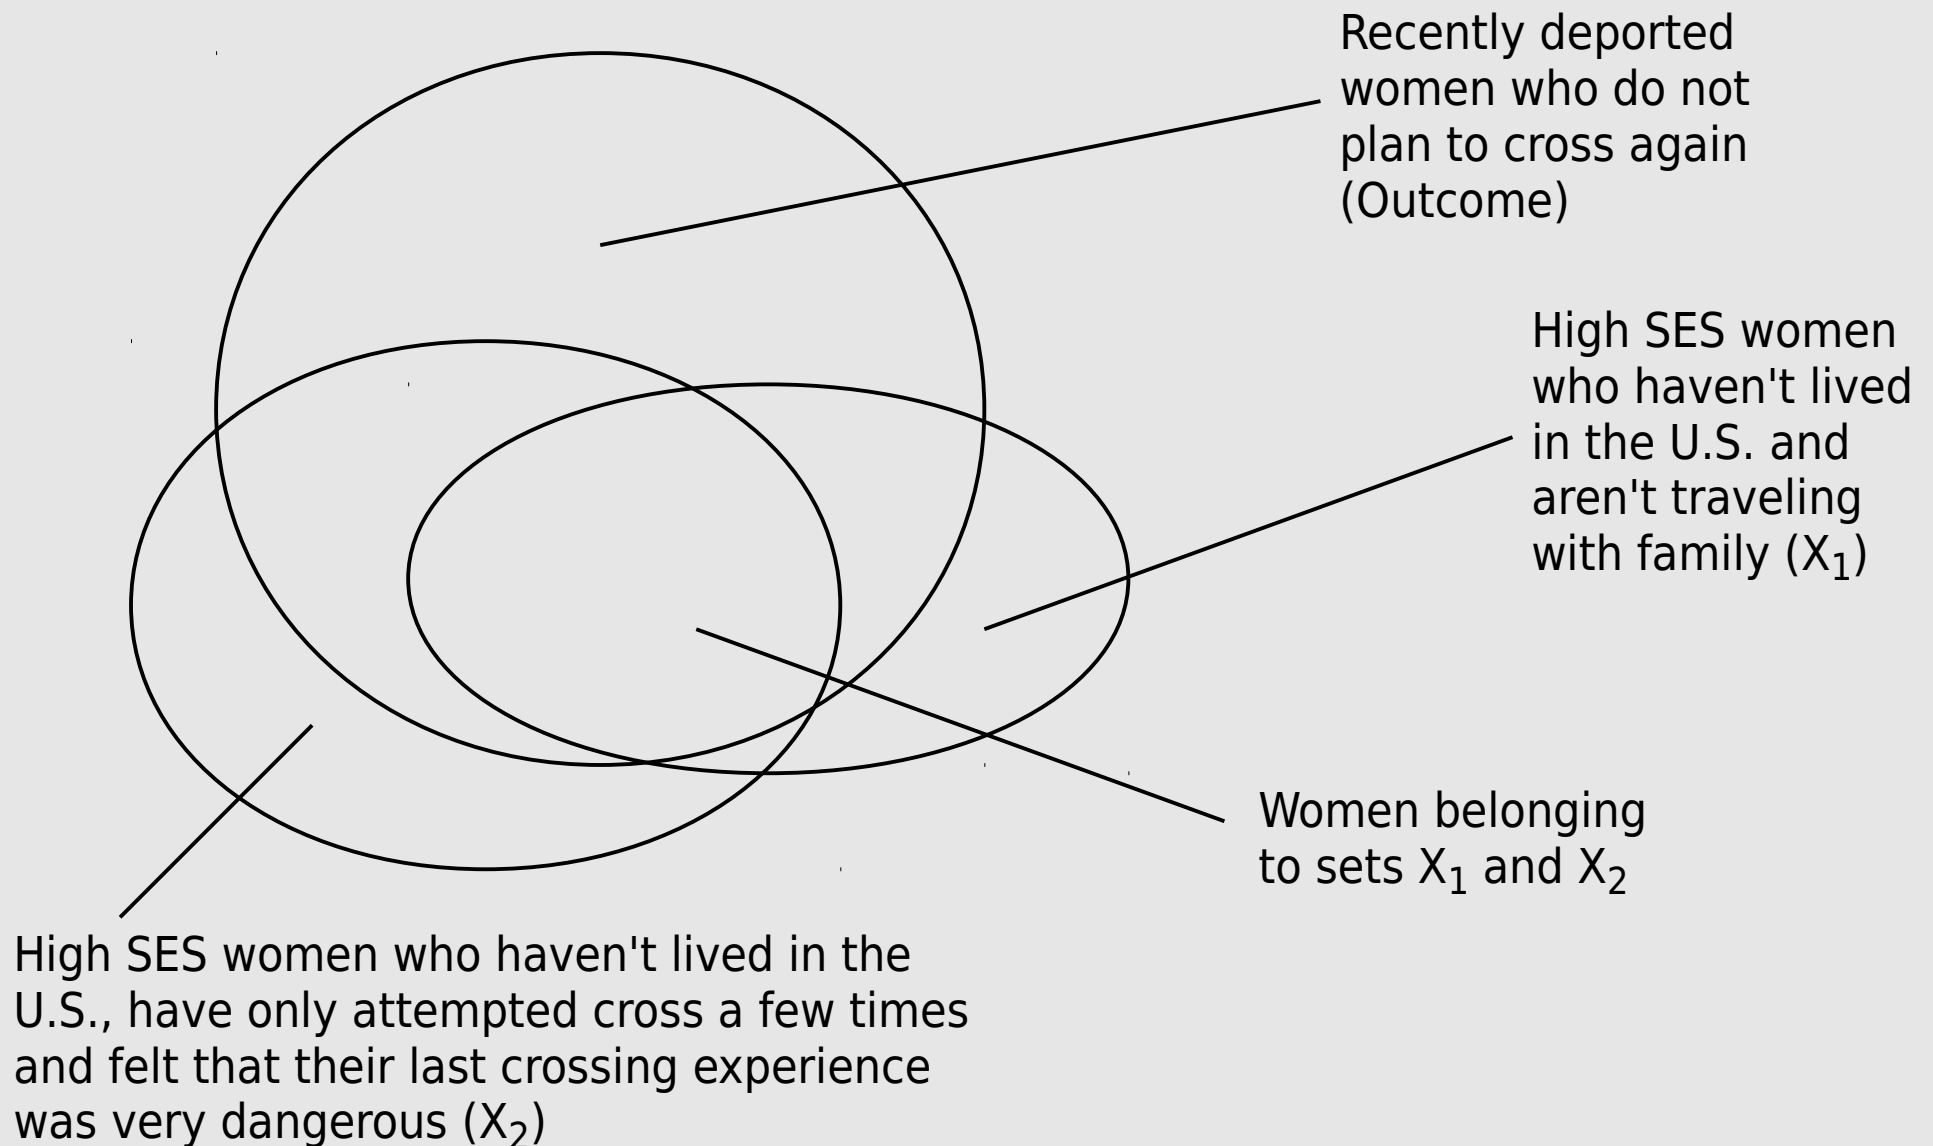

# Assessing Sufficient Conditions

- *Coverage* measures the relative “importance” of each solution

# Assessing Sufficient Conditions

- *Coverage* measures the relative “importance” of each solution

# Testing for Sufficient Conditions

# Reading Truth Tables

Truth table assesses consistency between types and outcome

Democracy usually did not break down in countries that were (a) developed, urbanized, and literate (row 1) or (b) developed, not urbanized, and literate (row 3).

Democracy usually did break down in countries that were (c) not developed, not urbanized, and literate (row 7) or (d) not developed, not urbanized, and not literate (row 8)
